As the condition for the system to be stable is

$$\sum_{n=-\infty}^{\infty} |h(n)| < \infty \quad (1.0.8)$$

(5.3) The system with  $h(n)$  is defined to be stable if

$$\sum_{n=-\infty}^{\infty} |h(n)| < \infty \quad (0.0.1)$$

By substituting  $h(n)$  we get,

Is the system defined by (3.2) stable for impulse response in (5.1)?

$$\sum_{n=-\infty}^{\infty} |h(n)| = \sum_{n=-\infty}^{\infty} \left| \left[ \frac{-1}{2} \right]^n u(n) + \left[ \frac{-1}{2} \right]^{n-2} u(n-2) \right| \quad (1.0.9)$$

1 SOLUTION

¢

Given difference equation,

$$y(n) + \frac{1}{2}y(n-1) = x(n) + x(n-2) \quad (1.0.1)$$

By applying Z-transform we get,

$$Y(z) + \frac{1}{2}z^{-1}Y(z) = X(z) + z^{-2}X(z) \quad (1.0.2)$$

$$Y(z) = \frac{2(z^2 + 1)}{z(2z + 1)}X(z) \quad (1.0.3)$$

Therefore  $H(z)$  is

$$H(z) = \frac{2(z^2 + 1)}{z(2z + 1)} \quad (1.0.4)$$

$$H(z) = \frac{1 + z^{-2}}{1 + \frac{1}{2}z^{-1}} \quad (1.0.5)$$

$$H(z) = z^{-1} \left[ \frac{1}{1 + \frac{1}{2}z^{-1}} + \frac{z^{-2}}{1 + \frac{1}{2}z^{-1}} \right] \quad (1.0.6)$$

By applying inverse z-transform we get,

$$h(n) = \left[ \frac{-1}{2} \right]^n u(n) + \left[ \frac{-1}{2} \right]^{n-2} u(n-2) \quad (1.0.7)$$

$$= \sum_{n=-\infty}^{\infty} \left| (-1)^n \left( \left[ \frac{-1}{2} \right]^n u(n) + \left[ \frac{-1}{2} \right]^{n-2} u(n-2) \right) \right| \quad (1.0.10)$$

$$= \sum_{n=-\infty}^{\infty} \left| \left[ \frac{1}{2} \right]^n u(n) + \left[ \frac{1}{2} \right]^{n-2} u(n-2) \right| \quad (1.0.11)$$

$$= \sum_{n=-\infty}^{\infty} \left[ \frac{1}{2} \right]^n u(n) + \sum_{n=-\infty}^{\infty} \left[ \frac{1}{2} \right]^{n-2} u(n-2) \quad (1.0.12)$$

$$= \sum_{n=0}^{\infty} \left[ \frac{1}{2} \right]^n + \sum_{n=2}^{\infty} \left[ \frac{1}{2} \right]^{n-2} \quad (1.0.13)$$

$$= \left[ \frac{1}{1 - \frac{1}{2}} \right] + \left[ \frac{1}{1 - \frac{1}{2}} \right] \quad (1.0.14)$$

$$= 2 + 2 \quad (1.0.15)$$

$$= 4 < \infty \quad (1.0.16)$$

As the given system satisfies the stability condition. Therefore, the system is stable.

¢

**BIBO Stability:** A system is said to be stable, if the bounded input produces the bounded output.

Let  $x(n)$  is bounded sequence.

$$|x(n)| < M_x \quad (1.0.17)$$

Where  $M_x$  is a finite value. From the convolution property,

$$y(n) = \sum_{-\infty}^{\infty} h(k)x(n-k) \quad (1.0.18)$$

$$|y(n)| = \left| \sum_{-\infty}^{\infty} h(k)x(n-k) \right| \quad (1.0.19)$$

$$|y(n)| \leq M_x \sum_{-\infty}^{\infty} |h(k)| \quad (1.0.20)$$

Because all  $x(k)$  less than  $M_x$ .

As  $M_x$  is finite, for  $|y(n)|$  to be finite

$$\sum_{-\infty}^{\infty} |h(n)| < \infty \quad (1.0.21)$$

$$\text{then } |y(n)| \leq M_y < \infty \quad (1.0.22)$$

for the bounded input. Hence, the given system is stable.

Hence, we can say that the output is bounded if the impulse response is absolutely summable.

Given-

$$y(n) + \frac{1}{2}y(n-1) = x(n) + x(n-2) \quad (1.0.23)$$

$$y(n) = 0 \text{ for } y < 0 \quad (1.0.24)$$

and the given bounded input is

$$x(n) = \{1, 1, 2, 4, 3, 1\} \quad (1.0.25)$$

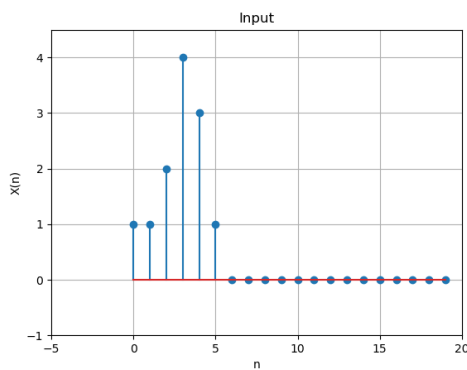

Fig. 0: Input

and the output we get,

Here we can see that we are getting bounded output

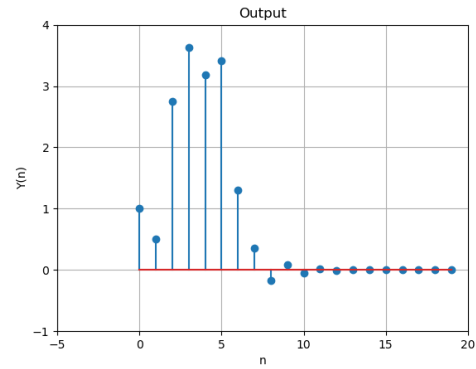

Fig. 0: Bounded output
